TECHNICAL DATA SHEET

NO. 38 BOILER COMPOUND

This product is designed to provide scale and corrosion protection for closed chilled-loop and hot water systems. It is a balanced boiler compound based on sodium molybdate but also contains sodium nitrite for added effectiveness. It provides excellent corrosion protection even at elevated temperatures by establishing a protective film within the system. This product is not recommended for use in steam boiler applications.

DIRECTIONS: For maximum corrosion protection, a sodium molybdate level of 150-200 ppm (90-100 ppm molybdenum) should be maintained within the system by using a feed rate of approximately 1 part product to 250 parts of water. The pH of the boiler water should be kept at 10 - 11.
